

# EXPERIMENT NO. 6

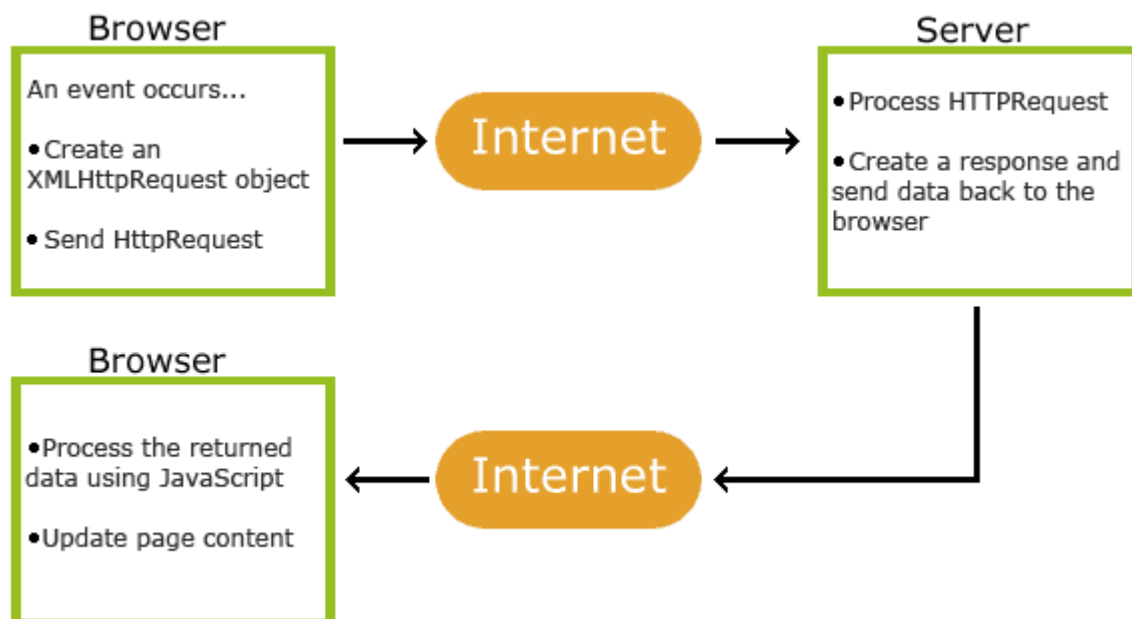

**Aim:** Implement search functionality using Php and ajax.

## **Theory:**

### **#What is AJAX ?**

Ajax can be used to create more user friendly and interactive searches.

AJAX = Asynchronous JavaScript and XML. AJAX is a technique for creating fast and dynamic web pages. AJAX allows web pages to be updated asynchronously by exchanging small amounts of data with the server behind the scenes. This means that it is possible to update parts of a web page, without reloading the whole page.

**Fig. How Ajax works**

### **#Steps to create a live search of states using ajax:**

**Step 1:** Create a database in localhost/phpMyAdmin/ and name it as 'exp6'.

**Step 2:** Create table within it and name it as 'states'. Name three columns as state\_id, state\_name and state\_code.

**Step 3:** Later, create a form for live search using AJAX. Create a simple web interface that allows user to live search the names of states available in our country table, just like an autocomplete or typeahead.

Create a PHP file named "exp6.php"

**Step 4:** Create a .php file to process the query in backend. the source code in 'query.php' file which searches the database based on query string sent by the Ajax request and send the results back to browser.

➔ Search bar body in 'exp6.php'

```
<body>

<div id="search_container">
  <h1>Search for country</h1>
  <input type="text" name="country" id="country" autocomplete="off" id
    = "search-input">
  <div id="results" style=" font-size: x-large;"></div>
</div>

<script type="text/javascript">
  $(document).ready(function(){
    $("#country").keyup(function(){
      var query = $(this).val();
      if (query != "") {
        $.ajax({
          url: 'query.php',
          method: 'POST',
          data: {query:query},
          success: function(data)
          {
            $('#results').html(data);
            $('#results').css('display', 'block');

            $("#country").focusout(function(){
              $('#results').css('display', 'none');
            });
            $("#country").focusin(function(){
              $('#results').css('display', 'block');
            });
          }
        });
      } else {
        $('#results').css('display', 'none');
```

```

    }
  });
});
</script>

</body>

```

➔ Php code in 'query.php' file.

```

<?php

$connect = mysqli_connect("localhost", "root", "H@rsh@123", "exp6");

if (isset($_POST['query'])) {

    $search_query = $_POST['query'];

    $query = "SELECT * FROM countries WHERE country_name LIKE '$search_
query%' LIMIT 12";
    $result = mysqli_query($connect, $query);

    if (mysqli_num_rows($result) > 0) {
        while ($country_row = mysqli_fetch_array($result)) {
            echo $country_row['country_name']."<br/>";
        }
    } else {
        echo "<p style='color:red'>Country not found...</p>";
    }
}

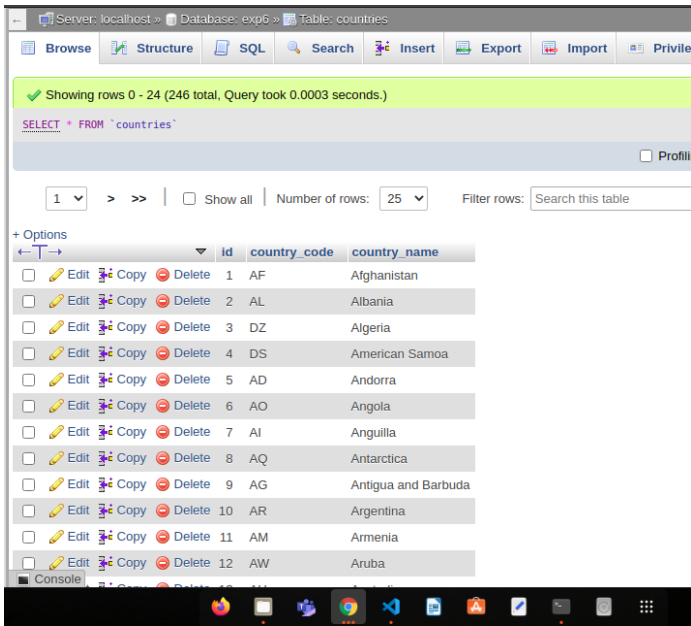

?>

```

Over here, using AJAX and JQuery we take input from user and based on their input we suggest country names to them which are fetched from database. Using this functionality we can implement Live search in AJAX with database connection.

OUTPUT:

`Countries` Table

The screenshot shows the phpMyAdmin interface for a database named 'exp6'. The 'countries' table is selected, and the SQL tab is active. A query is executed: `SELECT * FROM `countries``. The result shows 24 rows. The table structure is as follows:

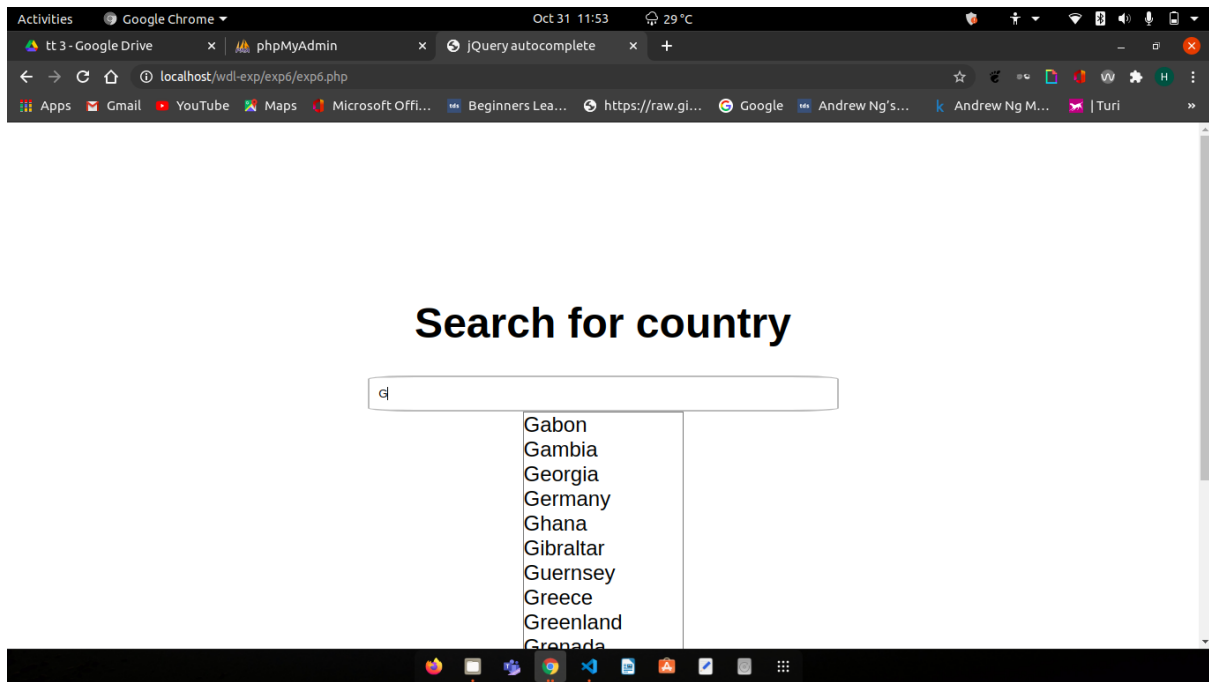

|                          | id | country_code | country_name        |
|--------------------------|----|--------------|---------------------|
| <input type="checkbox"/> | 1  | AF           | Afghanistan         |
| <input type="checkbox"/> | 2  | AL           | Albania             |
| <input type="checkbox"/> | 3  | DZ           | Algeria             |
| <input type="checkbox"/> | 4  | DS           | American Samoa      |
| <input type="checkbox"/> | 5  | AD           | Andorra             |
| <input type="checkbox"/> | 6  | AO           | Angola              |
| <input type="checkbox"/> | 7  | AI           | Anguilla            |
| <input type="checkbox"/> | 8  | AQ           | Antarctica          |
| <input type="checkbox"/> | 9  | AG           | Antigua and Barbuda |
| <input type="checkbox"/> | 10 | AR           | Argentina           |
| <input type="checkbox"/> | 11 | AM           | Armenia             |
| <input type="checkbox"/> | 12 | AW           | Aruba               |

`Search bar/interface`

Search for country

**Conclusion:** Thus, we have successfully understand and implemented search functionality using Php and Ajax.
